

Memo - DevOps - Git and GitHub

Git Bash

- Bash Terminal Command

Unix/Linux Command

File Commands	System Info
<p>ls - directory listing ls -al - formatted listing with hidden files cd dir - change directory to <i>dir</i> cd - change to home pwd - show current directory mkdir dir - create a directory <i>dir</i> rm file - delete <i>file</i> rm -r dir - delete directory <i>dir</i> rm -f file - force remove <i>file</i> rm -rf dir - force remove directory <i>dir</i> * cp file1 file2 - copy <i>file1</i> to <i>file2</i> cp -r dir1 dir2 - copy <i>dir1</i> to <i>dir2</i>; create <i>dir2</i> if it doesn't exist mv file1 file2 - rename or move <i>file1</i> to <i>file2</i> if <i>file2</i> is an existing directory, moves <i>file1</i> into directory <i>file2</i> ln -s file link - create symbolic link <i>link</i> to <i>file</i> touch file - create or update <i>file</i> cat > file - places standard input into <i>file</i> more file - output the contents of <i>file</i> head file - output the first 10 lines of <i>file</i> tail file - output the last 10 lines of <i>file</i> tail -f file - output the contents of <i>file</i> as it grows, starting with the last 10 lines</p>	<p>date - show the current date and time cal - show this month's calendar uptime - show current uptime w - display who is online whoami - who you are logged in as finger user - display information about <i>user</i> uname -a - show kernel information cat /proc/cpuinfo - cpu information cat /proc/meminfo - memory information man command - show the manual for <i>command</i> df - show disk usage du - show directory space usage free - show memory and swap usage whereis app - show possible locations of <i>app</i> which app - show which <i>app</i> will be run by default</p>
Process Management	Compression
<p>ps - display your currently active processes top - display all running processes kill pid - kill process id <i>pid</i> killall proc - kill all processes named <i>proc</i> * bg - lists stopped or background jobs; resume a stopped job in the background fg - brings the most recent job to foreground fg n - brings job <i>n</i> to the foreground</p>	<p>tar cf file.tar files - create a tar named <i>file.tar</i> containing <i>files</i> tar xf file.tar - extract the files from <i>file.tar</i> tar czf file.tar.gz files - create a tar with Gzip compression tar xzf file.tar.gz - extract a tar using Gzip tar cjf file.tar.bz2 - create a tar with Bzip2 compression tar xjf file.tar.bz2 - extract a tar using Bzip2 gzip file - compresses <i>file</i> and renames it to <i>file.gz</i> gzip -d file.gz - decompresses <i>file.gz</i> back to <i>file</i></p>
File Permissions	Network
<p>chmod octal file - change the permissions of <i>file</i> to <i>octal</i>, which can be found separately for user, group, and world by adding:</p> <ul style="list-style-type: none"> 4 - read (r) 2 - write (w) 1 - execute (x) <p>Examples: chmod 777 - read, write, execute for all chmod 755 - rwx for owner, rx for group and world For more options, see man chmod.</p>	<p>ping host - ping <i>host</i> and output results whois domain - get whois information for <i>domain</i> dig domain - get DNS information for <i>domain</i> dig -x host - reverse lookup <i>host</i> wget file - download <i>file</i> wget -c file - continue a stopped download</p>
SSH	Installation
<p>ssh user@host - connect to <i>host</i> as <i>user</i> ssh -p port user@host - connect to <i>host</i> on port <i>port</i> as <i>user</i> ssh-copy-id user@host - add your key to <i>host</i> for <i>user</i> to enable a keyed or passwordless login</p>	<p>Install from source: ./configure make make install dpkg -i pkg.deb - install a package (Debian) rpm -Uvh pkg.rpm - install a package (RPM)</p>
Searching	Shortcuts
<p>grep pattern files - search for <i>pattern</i> in <i>files</i> grep -r pattern dir - search recursively for <i>pattern</i> in <i>dir</i> command grep pattern - search for <i>pattern</i> in the output of <i>command</i> locate file - find all instances of <i>file</i></p>	<p>Ctrl+C - halts the current command Ctrl+Z - stops the current command, resume with fg in the foreground or bg in the background Ctrl+D - log out of current session, similar to exit Ctrl+W - erases one word in the current line Ctrl+U - erases the whole line Ctrl+R - type to bring up a recent command !! - repeats the last command exit - log out of current session</p>
	<p>* use with extreme caution.</p> 

```

shum@sol:~$ ls -l
total 20
drwx----- 2 shum  staff  4096 Jan 16 22:04 Mail
drwx----- 3 shum  staff  4096 Jan 16 14:15 csc128
drwxr-xr-x  2 shum  staff  4096 Jan 13 16:42 public
drwxr-xr-x  2 shum  staff  4096 Jan 16 14:07 public_html
-rw-r--r--  1 shum  staff   628 Jan 15 20:04 verse
    
```

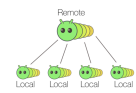

Diagram explaining the fields in the `ls -l` command output:

- file type**: Points to the first character of the permissions string (e.g., 'd' for directory).
- number of hard links**: Points to the number of links (e.g., '2').
- user (owner) name**: Points to the owner name (e.g., 'shum').
- group name**: Points to the group name (e.g., 'staff').
- size**: Points to the file size in bytes (e.g., '4096').
- date/time last modified**: Points to the date and time (e.g., 'Jan 16 22:04').
- filename**: Points to the file name (e.g., 'Mail').
- permissions breakdown**: Points to the permissions string 'rwx', which is further broken down into:
 - readable**: Points to 'r'.
 - writable**: Points to 'w'.
 - executable**: Points to 'x'.
- other (everyone) permissions**: Points to the permissions for 'other' (e.g., '---').
- group permissions**: Points to the permissions for the group (e.g., '---').
- user permissions**: Points to the permissions for the user (e.g., '---').

- Git Hub

Git Cheat Sheet

Good things to know

Git is a **distributed** version control system. Everyone that has a local copy of the repository at all times. Cannot be partially checked out, it's all or nothing.

Git ≠ GitHub

Git is not Github
Git is a repository, where files are stored and managed. Github is a hosting service that keeps your Git repo in the cloud.

Git CLI is **very powerful**. OK, that's not a "fact", but once you get used to it, you'll be able to use the commands anywhere. You can also use CLI and GUIs interchangeably on the same Git repository.

There are **many ways** to get there. People use Git in many different ways, and projects may follow different Git flows. Don't be shy, ask around.

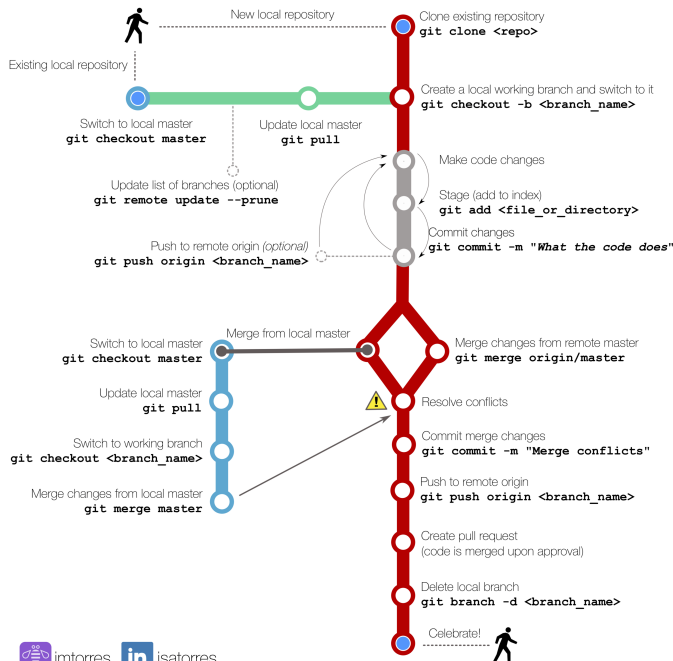

Terminology

- repository** - where files are stored, can be remote or local
- remote repository - repository in hosting server, also referred to as origin
- local repository - repository in local development machine
- branch** - a stream of work where commits are kept, can be remote or local
- remote branch - branch with published commits (commits that have been pushed)
- local branch - branch with unpublished commits, only developer can see, not shared
- commit** - a change unit, it is a scope of changes that are kept in sequential order

- master branch** - main stream of work, must always be stable
- working branch** - developer's stream of work, sandbox
- staging area/index** - keeps files to include in next commit
- push** - publish changes to remote
- pull** - merge remote changes into local changes
- pull request** - code review process to allow a change be integrated to the master branch

Simple flow of getting things done with Git

Scenario: developer working in individual branch, team code (stable) lives in the master branch

FREE!

Commands that you can use anytime

- See the status of the working branch: `git status`
- See the commit history: `git log`
- See all branches (remote - since last remote update): `git branch -a`

Resolve conflicts

No need to panic! Use a merge tool, or...

```
(remove) <<<<<< HEAD
(merge)   your local code
(remove)  =====
(merge)   code in master
(remove)  >>>>>> master
```

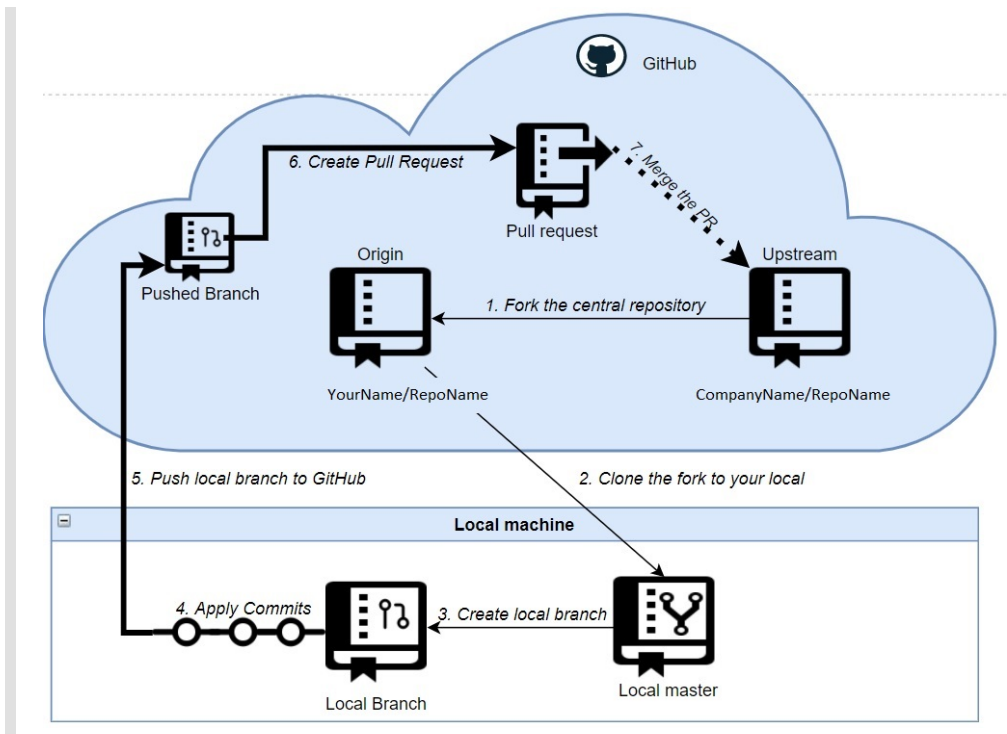

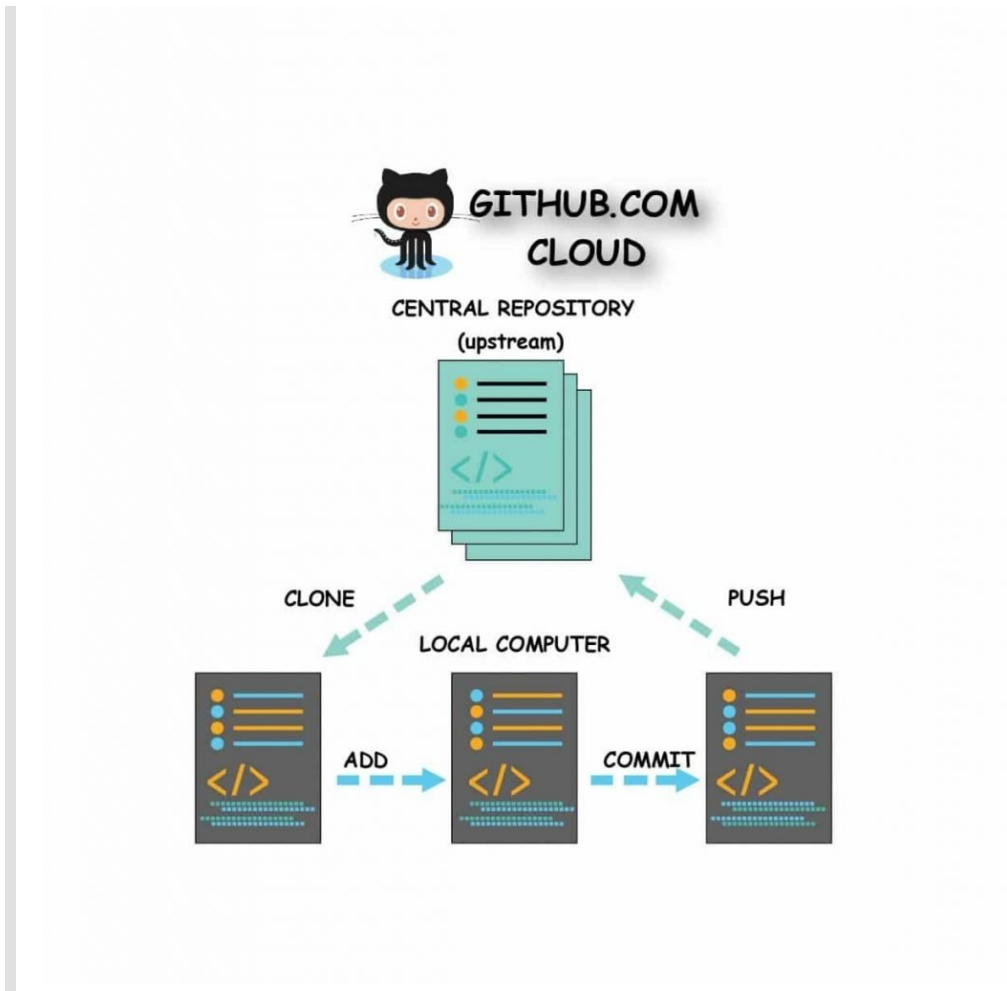

Mark the conflict resolved

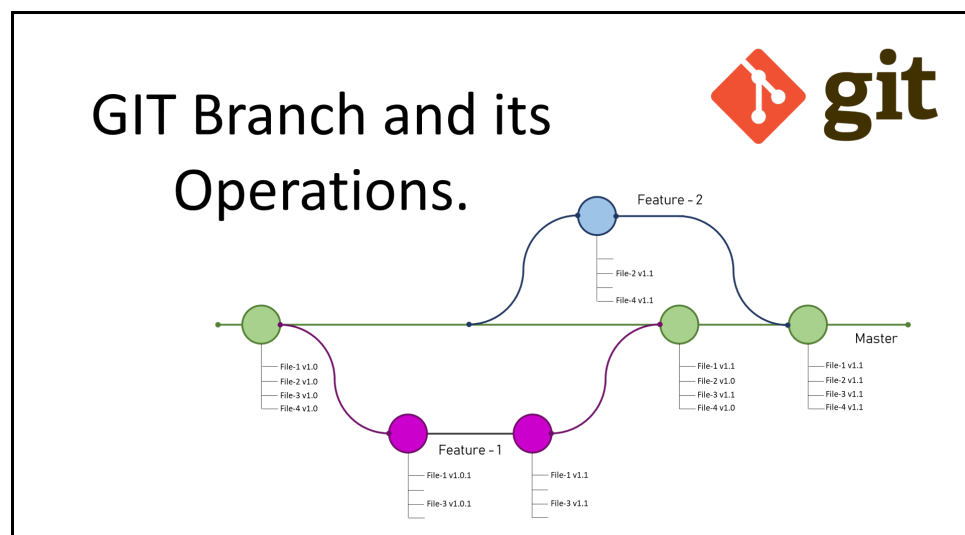

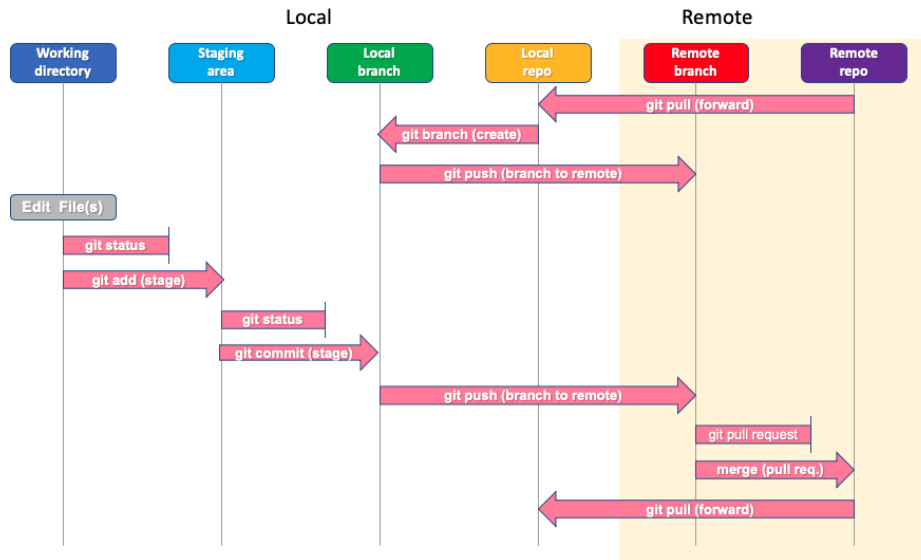

```
git add <file>
```

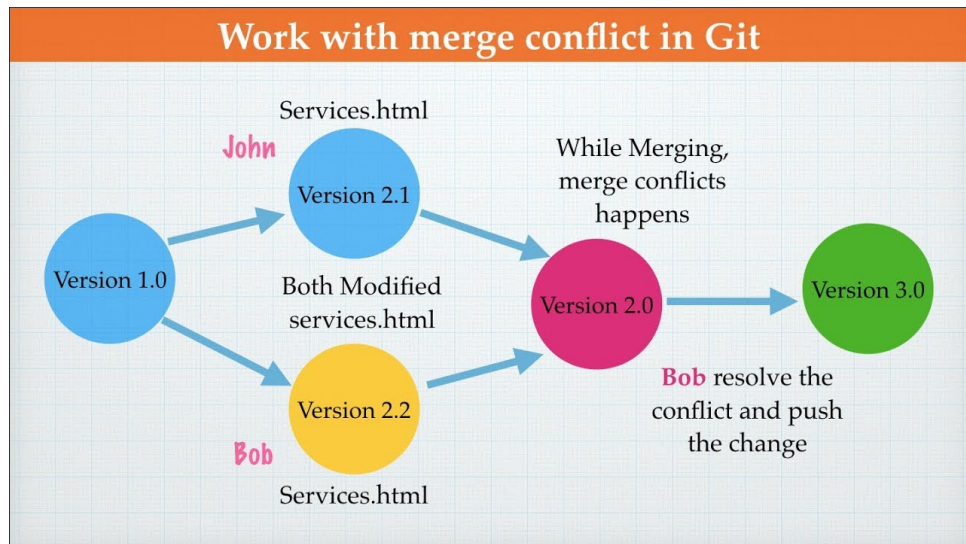

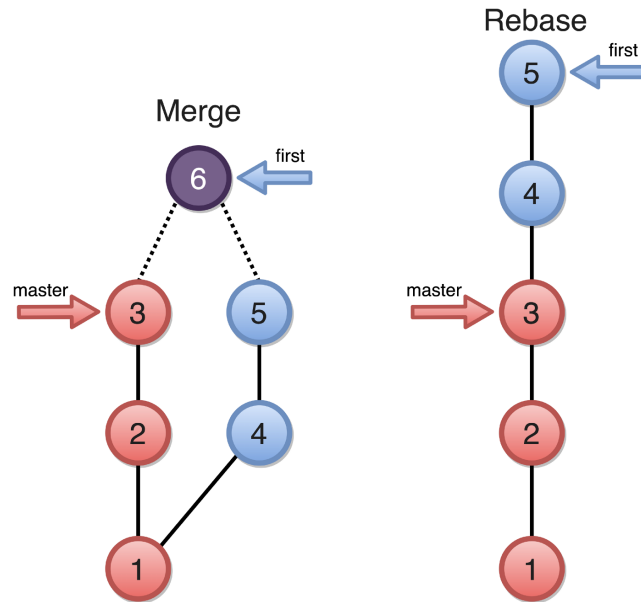

Want to start over? Roll back all the merged changes

```
git reset --hard HEAD
```

git basic

- git init
- git status
- git add .
- git add all
- git reset
- git restore filename
- git commit -m "xxxxxx"
- git commit -v --amend (for changing the commit message)
- git restore --staged filename
- git push
- git pull
- git log
- git log --oneline
- git remote remove

git branch

- `git branch --list`
- `git branch`
- `git branch -r`
- `git branch -a`
- `git branch newbranch(create newbranch)`
- `git checkout newbranch(switch to newbranch)`
- `git checkout -b newbranch(create newbranch and switch to newbranch)`
- `git branch -D branch(delete branch)`
- `git checkout -`
- `git branch -m oldbranchname newbranchname`

git merge

- `git checkout main`
- `git merge branch_A*(merge branch_A to main)`

-> **conflict**

-> `git merge --abort` -> `git pull + amend file + git add file + git commit -m "xxx" + git push`

git rebase

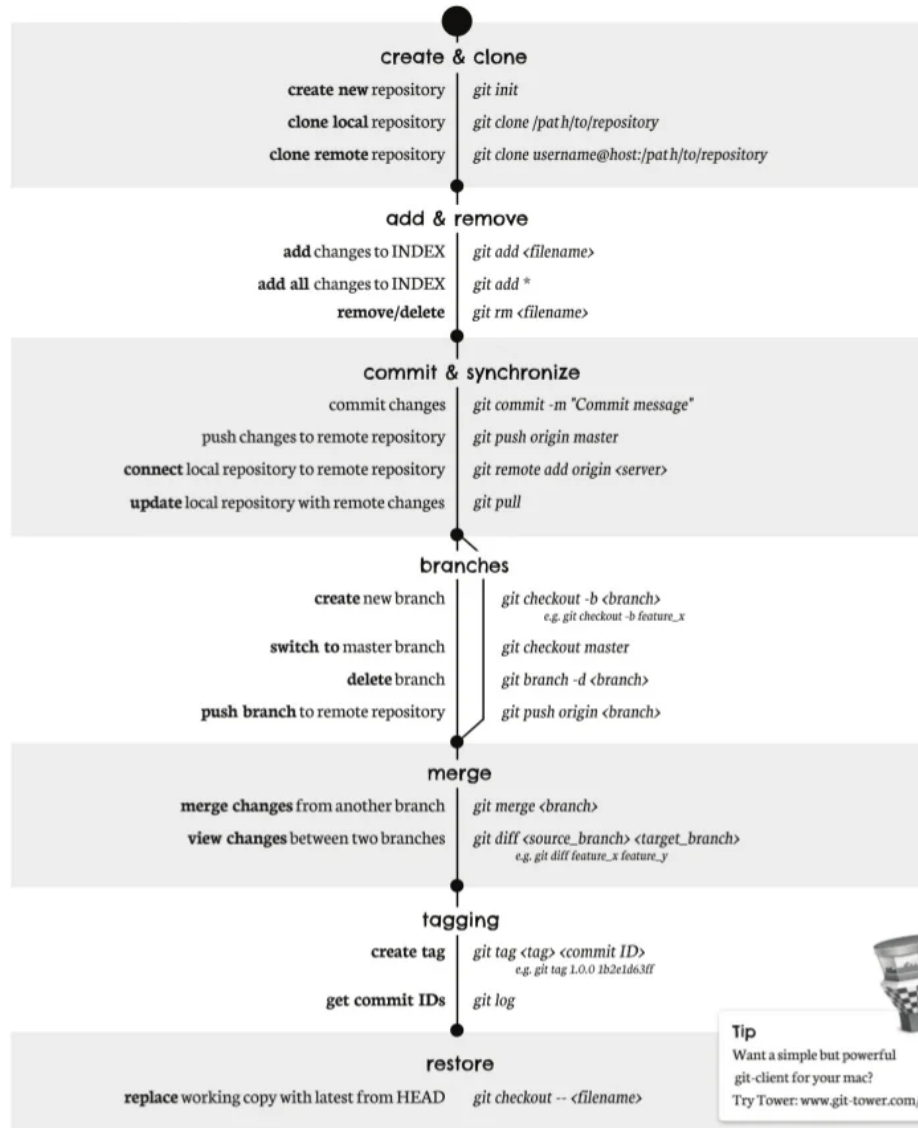

- `git rebase --continue`

Undo

- `git checkout log_id(`switch to log_id)
- `git revert log_id(`automerge -> undo to log_id status)
- `git reset log_id(`unstage changes after log_id)
- `git reset log_id --hard(`delete commits after log_id)

Remember: `git command --help`
Global Git configuration is stored in `$HOME/.gitconfig` (`git config --help`)

Create	Concepts
<p>From existing data</p> <pre>cd ~/projects/myproject git init git add .</pre> <p>From existing repo</p> <pre>git clone --existing/repo ~/new/repo git clone git://host.org/project.git git clone ssh://you@host.org/proj.git</pre> <p>Show</p> <pre>git status</pre> <p>Files changed in working directory</p> <pre>git status</pre> <p>Changes to tracked files</p> <pre>git diff</pre> <p>What changed between \$ID1 and \$ID2</p> <pre>git diff \$id1 \$id2</pre> <p>History of changes</p> <pre>git log</pre> <p>History of changes for file with diffs</p> <pre>git log -p \$file \$dir/ec/ory/</pre> <p>Who changed what and when in a file</p> <pre>git blame \$file</pre> <p>A commit identified by \$ID</p> <pre>git show \$id</pre> <p>A specific file from a specific \$ID</p> <pre>git show \$id:\$file</pre> <p>All local branches</p> <pre>git branch</pre> <p><small>(star "*" marks the current branches)</small></p>	<p>Git Basics</p> <p>master : default development branch origin : default upstream repository HEAD : current branch HEAD~ : parent of HEAD HEAD~4 : the great-great-grandparent of HEAD</p> <p>Revert</p> <p>Return to the last committed state</p> <pre>git reset --hard</pre> <p><small>⚠ you cannot undo a hard reset</small></p> <p>Revert the last commit</p> <pre>git revert HEAD</pre> <p><small>Creates a new commit</small></p> <p>Revert specific commit</p> <pre>git revert \$id</pre> <p><small>Creates a new commit</small></p> <p>Fix the last commit</p> <pre>git commit -a --amend</pre> <p><small>(after editing the broken files)</small></p> <p>Checkout the \$id version of a file</p> <pre>git checkout \$id \$file</pre> <p>Branch</p> <p>Switch to the \$id branch</p> <pre>git checkout \$id</pre> <p>Merge branch1 into branch2</p> <pre>git checkout \$branch2 git merge branch1</pre> <p>Create branch named \$branch based on the HEAD</p> <pre>git branch \$branch</pre> <p>Create branch \$new_branch based on branch \$other and switch to it</p> <pre>git checkout -b \$new_branch \$other</pre> <p>Delete branch \$branch</p> <pre>git branch -d \$branch</pre>
<p>Cheat Sheet Notation</p> <p>\$id : notation used in this sheet to represent either a commit id, branch or a tag name \$file : arbitrary file name \$branch : arbitrary branch name</p>	

Commands Sequence

the curves indicate that the command on the right is usually executed after the command on the left. This gives an idea of the flow of commands someone usually does with Git.

Update

Fetch latest changes from origin

```
git fetch
```

(but does not merge them)

Pull latest changes from origin

```
git pull
```

(does a fetch followed by a merge)

Apply a patch that some sent you

```
git am -3 patch.mbox
```

(in case of a conflict, resolve and use git am --resolved)

Publish

Commit all your local changes

```
git commit -a
```

Prepare a patch for other developers

```
git format-patch origin
```

Push changes to origin

```
git push
```

Mark a version / milestone

```
git tag v1.0
```

Useful Commands

Finding regressions

```
git bisect start
```

(to start)

```
git bisect good $id
```

(\$id is the last working version)

```
git bisect bad $id
```

(\$id is a broken version)

```
git bisect bad/good
```

(to mark it as bad or good)

```
git bisect visualize
```

(to branch git and mark it)

```
git bisect reset
```

(once you're done)

Check for errors and cleanup repository

```
git fsck
git gc --prune
```

Search working directory for foo!

```
git grep "foo!"
```

Resolve Merge Conflicts

To view the merge conflicts

```
git diff
```

(complete conflict diff)

```
git diff --base $file
```

(against base file)

```
git diff --ours $file
```

(against your changes)

```
git diff --theirs $file
```

(against other changes)

To discard conflicting patch

```
git reset --hard
git rebase --skip
```

After resolving conflicts, merge with

```
git add $conflicting_file
```

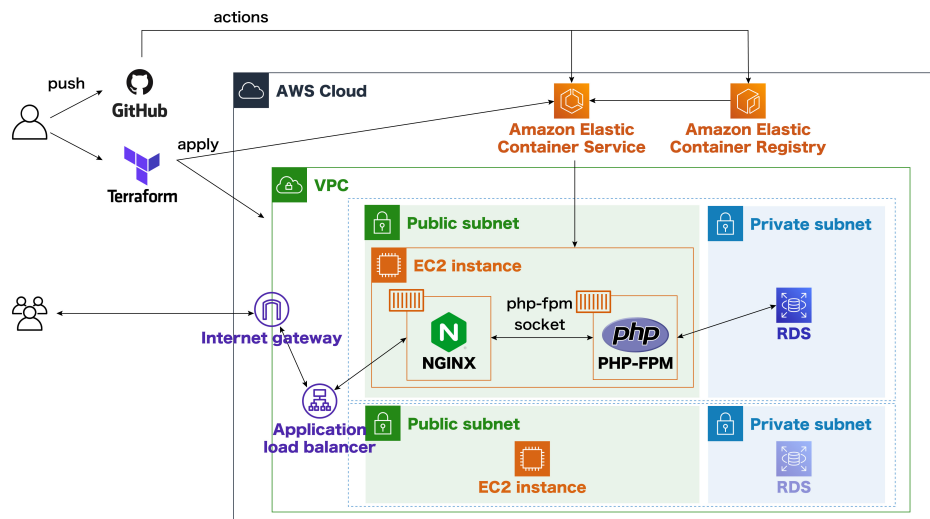

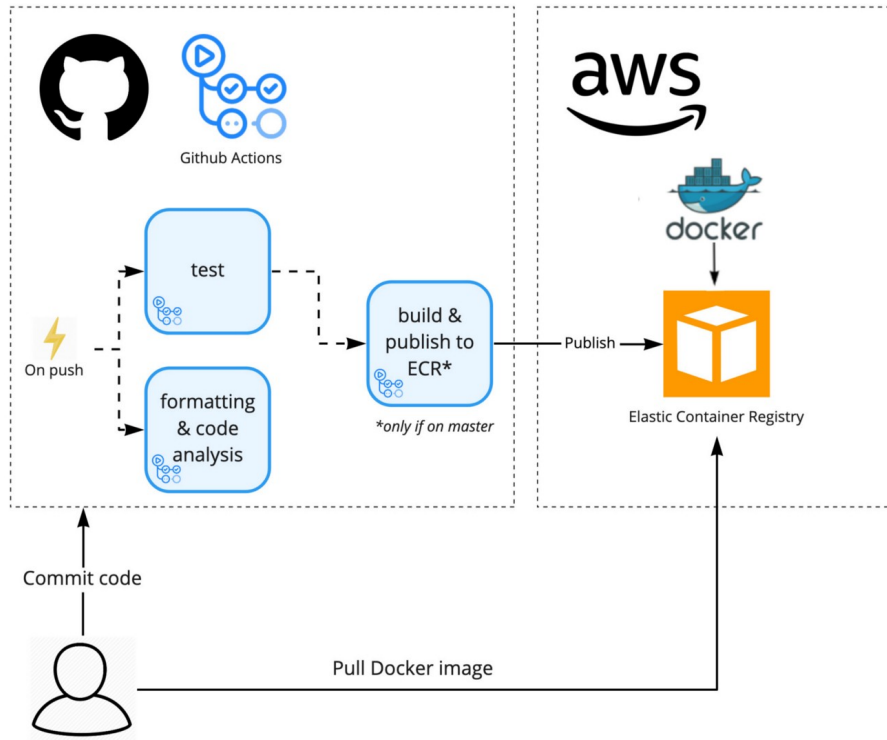

(do for all resolved files)

```
git rebase --continue
```
